

# pSELECT-mHMGB1-Lucia

A mammalian expression plasmid encoding a murine HMGB1::Lucia fusion protein

Catalog code: psetz-mhmgb1uc

<http://www.invivogen.com/pselect-hmgb1>

For research use only

Version 20K30-MM

## PRODUCT INFORMATION

### Contents

- 20 µg of pSELECT-mHMGB1-Lucia plasmid provided as lyophilized DNA
- 1 ml of Zeocin™ (100 mg/ml)

### Storage and stability

- Product is shipped at room temperature.
- Lyophilized DNA should be stored at -20°C.
- Resuspended DNA should be stored at -20°C and is stable for 1 year.
- Store Zeocin™ at 4 °C or at -20 °C. The expiry date is specified on the product label.

### Quality control

- Plasmid construct has been confirmed by restriction analysis and sequencing.
- Plasmid DNA has been purified by ion exchange chromatography.

## GENERAL PRODUCT USE

pSELECT plasmids are specifically designed for strong and constitutive expression of a gene of interest in a wide variety of cell lines. They allow variation in selection markers for obtaining stable transfecants. pSELECT plasmids contain two expression cassettes: the first one drives the expression of the gene of interest, and the second one drives the expression of a large choice of dominant selection markers for both *E. coli* and mammalian cells. Each cassette terminates with a strong polyadenylation signal (polyA) thus preventing any transcription interference. The late SV40 polyA terminates the transcription of the gene of interest while the human β-globin polyA terminates the transcription of the selection marker.

pSELECT-mHMGB1-Lucia is a mammalian expression vector containing the murine HMGB1 gene fused at its 3' end to the Lucia luciferase gene. This plasmid is selectable in bacteria and mammalian cells with Zeocin™. Expression of HMGB1::Lucia in cells equipped for inflammasome-mediated-pyroptosis and/or necroptosis allows monitoring of these forms of necrotic cell death. The release of the HMGB1::Lucia protein in the extracellular milieu upon pyroptosis or necroptosis can be readily measured using QUANTI-Luc™, a coelenterazine-based luminescence assay reagent.

## PLASMID FEATURES

### First expression cassette

- **hEF1-HTLV prom** is a composite promoter comprising the Elongation Factor-1α (EF-1α) core promoter and the R segment and part of the U5 sequence (R-U5') of the Human T-Cell Leukemia Virus (HTLV) Type 1 Long Terminal Repeat. The EF-1α promoter exhibits a strong activity and yields long lasting expression of a transgene *in vivo*. The R-U5' has been coupled to the EF-1α core promoter to enhance stability of RNA.

- **mHMGB1::Lucia** encodes a 46.5 kDa fusion protein in which the C-terminus of murine HMGB1 is fused to Lucia luciferase, a secreted coelenterazine-utilizing luciferase reporter protein. Levels of HMGB1::Lucia in the cell culture supernatant can be monitored by measuring the light signal produced after addition of QUANTI-Luc™.

- **SV40 pAn:** the Simian Virus 40 late polyadenylation signal enables efficient cleavage and polyadenylation reactions resulting in high levels of steady-state mRNA.

- **ori:** a minimal *E. coli* origin of replication to limit vector size, but with the same activity as the longer *Ori*.

### Second expression cassette

- **CMV enh/prom:** The human cytomegalovirus immediate-early gene 1 promoter/enhancer was originally isolated from the Towne strain and was found to be stronger than any other viral promoters.

- **EM7** is a bacterial promoter that enables the constitutive expression of the antibiotic resistance gene in *E. coli*.

- **Zeo:** Resistance to Zeocin™ is conferred by the *Sh ble* gene from *Streptomyces hindustanus*. The *Sh ble* gene is driven by the CMV enhancer/promoter in tandem with the bacterial EM7 promoter allowing selection in both mammalian cells and *E. coli*.

- **BGlo pAn:** The human beta-globin 3'UTR and polyadenylation sequence allows efficient arrest of the transgene transcription<sup>4</sup>.

## METHODS

### Plasmid resuspension

Quickly spin the tube containing the lyophilized plasmid to pellet the DNA. To obtain a plasmid solution at 1 µg/µl, resuspend the DNA in 20 µl of sterile H<sub>2</sub>O. Store resuspended plasmid at -20 °C.

### Plasmid amplification and cloning

Plasmid amplification and cloning can be performed in *E. coli* GT116 other commonly used laboratory *E. coli* strains, such as DH5α.

### Zeocin™ usage

This antibiotic can be used for *E. coli* at 25 µg/ml in liquid or solid media and at 50-200 µg/ml to select Zeocin™-resistant mammalian cells.
