RAW-Dual™ KO-TLR4 Cells

(IRF-Lucia/KI-[MIP-2]SEAP)

TLR4 knockout IRF and MIP-2 (NF-κB) reporter mouse macrophages

Catalog code: rawd-kotlr4

https://www.invivogen.com/raw-dual-ko-tlr4

For research use only

Version 23A06-MM

PRODUCT INFORMATION

Contents and Storage

- **3-7 x 10⁶ of RAW-Dual™ KO-TLR4 cells in a cryovial or shipping flask.** *IMPORTANT: If cells provided in a cryovial are not frozen upon arrival, contact InvivoGen immediately.*
- **1 ml of Zeocin®** (100 mg/ml). Store at 2-8 °C or at -20 °C.*
- **1 ml of Normocin™** (50 mg/ml), a formulation of three antibiotics active against mycoplasmas, bacteria and fungi. Store at -20 °C.*

*The expiry date is specified on the product label.

- **1 tube of QUANTI-Luc™ 4 Reagent**, a lucia luciferase detection reagent (sufficient to prepare 25 ml). Store at -20 °C. Avoid repeated freeze-thaw cycles.

Note: This product is photosensitive and should be protected from light.

- **1 ml of QB reagent** and **1 ml of QB buffer** (sufficient to prepare 100 ml of **QUANTI-Blue™ Solution**, a SEAP detection reagent). Store QB reagent and QB buffer at -20 °C. QUANTI-Blue™ Solution is stable for 2 weeks at 4 °C and for 2 months at -20 °C.

Note: Data sheets for all components are available on our website.

Handling Frozen Cells Upon Arrival

Cells must be thawed immediately upon receipt and grown according to handling procedures (as described on the next page) to ensure the best cell viability and proper assay performance.

Note: **Avoid freezing cells upon receipt** as it may result in irreversible damage to the cell line.

Disclaimer: We cannot guarantee cell viability if the cells are not thawed immediately upon receipt and grown according to handling procedures.

IMPORTANT: For cells that arrive in a shipping flask please refer to the enclosed 'cell recovery procedure'.

Cell Line Stability

Genetic instability is a biological phenomenon that occurs in all stably transfected cells. Cells will undergo genotypic changes resulting in reduced responsiveness over time in normal cell culture conditions. Therefore, it is critical to prepare an adequate number of frozen stocks at early passages.

Quality Control

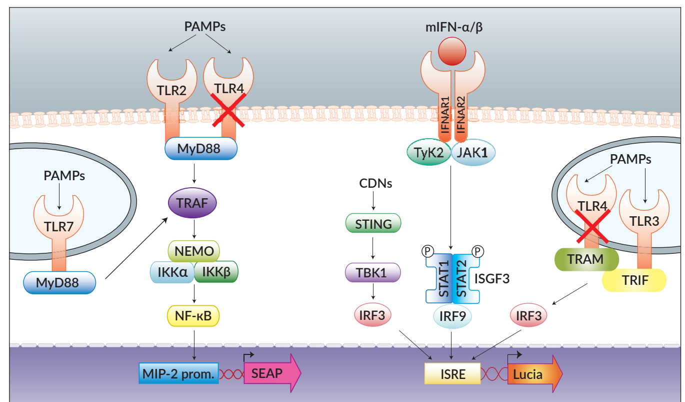
- Biallelic TLR4 knockout has been verified by DNA sequencing and functional assays.
- The biallelic replacement of the mouse MIP-2 (macrophage inflammatory protein-2; CXCL2; murine homolog of IL-8) open reading frame (ORF) with the SEAP reporter ORF has been verified by PCR and sequencing. Furthermore, the inability to produce MIP-2 has been confirmed by ELISA.
- The biological activity has been tested with pattern recognition receptor (PRR) ligands that trigger the NF-κB and interferon regulatory factor (IRF) signaling pathways.
- The stability for 20 passages following thawing has been verified.
- RAW-Dual™ KO-TLR4 cells are guaranteed mycoplasma-free.

RESTRICTIONS

These cells are distributed for research purposes only. This product is covered by a Limited Use License. By use of this product, the buyer agrees to the terms and conditions of all applicable Limited Use Label Licenses. For non-research use, such as screening, quality control or clinical development, contact info@invivogen.com.

INTRODUCTION

Toll-like receptor 4 (TLR4) is the receptor for Gram-negative lipopolysaccharide (LPS) and its toxic moiety called lipid A. TLR4 interacts with three different extracellular proteins: the LPS-binding protein (LBP), CD14, and the myeloid differentiation protein 2 (MD-2). Their interaction induces a signaling cascade resulting in the activation of NF-κB and the production of proinflammatory cytokines. LPS contamination is a common issue arising when testing novel compounds, such as recombinant proteins, leading to unreliable results. TLR4 knockout cells ensure the study of PRR pathways without interference from LPS.



PRODUCT DESCRIPTION

RAW-Dual™ KO-TLR4 (IRF-Lucia/KI-[MIP-2]SEAP) cells were generated from RAW-Dual™ cells through stable TLR4 gene knockout. They derive from RAW 264.7 murine macrophages which express many PRRs such as TLRs[1] and the cyclic dinucleotide (CDN) sensor STING[2]. RAW-Dual™ and RAW-Dual™ KO-TLR4 cells stably express two reporter genes encoding SEAP (secreted embryonic alkaline phosphatase) and Lucia luciferase. MIP-2 is a chemokine produced in an NF-κB-dependent manner[3]. The MIP-2 ORF has been replaced by the SEAP ORF using knockin technology. Hence, the expression of SEAP depends on the activation of the endogenous MIP-2 promoter. The Lucia luciferase gene is under the control of an ISG54 minimal promoter in conjunction with five IFN-stimulated response elements (ISRE). Both reporter proteins are secreted and readily measurable in the cell culture supernatant by using QUANTI-Blue™ Solution, a SEAP detection reagent, and QUANTI-Luc™ 4 Lucia/Gaussia, a Lucia and Gaussia luciferase detection reagent. RAW-Dual™ KO-TLR4 cells allow simultaneous study of the NF-κB and IRF pathways, by monitoring the activity of SEAP and Lucia luciferase, respectively. Unlike their parental cell line, RAW-Dual™ KO-TLR4 cells do not respond to TLR4 agonists. RAW-Dual KO-TLR4™ cells are resistant to Zeocin®.

www.invivogen.com

APPLICATIONS

RAW-Dual™ KO-TLR4 cells, along with their parental cell line RAW-Dual™ cells, are useful for:
- Investigating TLR4 signaling
- Studying TLR4-independent biological activity of test compounds

SAFETY CONSIDERATIONS

Biosafety Level 2

HANDLING PROCEDURES

Required Cell Culture Medium

- **Growth Medium:** DMEM, 4.5 g/l glucose, 2 mM L-glutamine, 10% heat-inactivated fetal bovine serum (FBS; 30 min at 56 °C), 100 µg/ml Normocin™, Pen-Strep (100 U/ml-100 µg/ml)
- **Freezing Medium:** DMEM, 4.5 g/l glucose, 20% FBS, 10% DMSO
- **Test Medium:** DMEM 4.5 g/l glucose, 2 mM L-glutamine, 10% heat-inactivated FBS, Pen-Strep (100 U/ml-100 µg/ml) **without Normocin™ and Zeocin®**

Required Selective Antibiotic

- Zeocin®

Initial Culture Procedure

The first propagation of cells should be for generating stocks for future use. This ensures the stability and performance of the cells for subsequent experiments.

1. Thaw the vial by gentle agitation in a 37 °C water bath. To reduce the possibility of contamination, keep the O-ring and cap out of the water. Thawing must be rapid.
2. Remove the vial from the water bath as soon as the contents are thawed, and decontaminate by dipping in or spraying with 70% ethanol.

Note: All steps from this point should be carried out under strict aseptic conditions.

3. Transfer cells into a larger vial containing 15 ml of pre-warmed growth medium. **Do not add selective antibiotics until the cells have been passaged twice.**
4. Centrifuge vial at 150 x g (RCF) for 10 minutes.
5. Remove supernatant containing the cryoprotective agent and resuspend cells with 1 ml of growth medium without selective antibiotics.
6. Transfer the vial contents to a T-25 culture flask containing 5 ml of growth medium.
7. Place the culture at 37 °C in 5% CO_2.

Frozen Stock Preparation

1. Resuspend cells at a density of 5-7 x 10^6 cells/ml in freezing medium freshly prepared with cold DMEM.

Note: A T-75 culture flask typically yields enough cells to prepare 3-4 frozen vials.

2. Aliquot 1 ml cells into cryogenic vials.
3. Place vials in a freezing container and store at -80 °C overnight.
4. Transfer vials to liquid nitrogen for long-term storage.

Note: If properly stored, cells should remain stable for years.

Cell Maintenance

1. After cells have recovered, subculture the cells in growth medium with an initial seeding density of 1.5 x 10^4 cells per cm^2 (e.g. ~1 x 10^6 cells in a T-75 culture flask). To maintain selection pressure, add 200 µg/ml of Zeocin® to the growth medium every other passage.
2. Renew growth medium twice a week.
3. Using a cell scraper, cells should be passaged when a 70-80% confluency is reached. Do not let the cells grow to 100% confluency.

Note: Do **not** *use trypsin.*

Cell-Handling Recommendations

To ensure the best results:
- Use RAW-Dual™ KO-TLR4 cells with less than 20 passages.
- Handling of cells should be as short as possible to prevent any damage resulting from a prolonged stay at room temperature without 5% CO_2.

REPORTER ASSAYS

Protocols have been optimized for NF-κB and IRF induction. **Three days prior** to the reporter assay, cells must be seeded at a density of 5 x 10^4 cells per cm^2 (e.g. 3.75 x 10^6 cells in a T-75 culture flask).

Cell Preparation

Use RAW-Dual™ KO-TLR4 cells with RAW-Dual™ cells (parental cell line).

1. Remove medium from RAW-Dual™ KO-TLR4 cells and rinse twice with pre-warmed PBS.
2. Using a cell scraper, detach cells and resuspend at ~1 x 10^6 cells/ml in **test medium.**

Important: To ensure reproducible results, homogenize the cell suspension.

NF-κB Induction

1. Add 20 µl of test compound per well of a flat-bottom 96-well plate, including a positive control (e.g. Pam3CSK4 at 1 µg/ml final concentration) and endotoxin free water as a negative control.
2. Add 20 µl of a TLR4 agonist (e.g. LPS-EK Ultrapure at 1 µg/ml final concentration) in another well.

Note: This ligand will induce SEAP activity in the parental RAW-Dual™ cells but not in RAW-Dual™ KO-TLR4 cells.

3. Add 180 µl of cell suspension (**~200,000 cell**s) per well.
4. Incubate the plate at 37 °C in a CO_2 incubator for 18-24 h.
5. Prepare QUANTI-Blue™ Solution following the instructions on the data sheet.
6. Add 20 µl of RAW-Dual™ KO-TLR4 cells supernatant.
7. Add 180 µl of QUANTI-Blue™ Solution per well of a flat-bottom 96-well plate.
8. Incubate the plate at 37 °C in a CO_2 incubator for 1-6 h.
9. Determine SEAP levels using a spectrophotometer at 620-655 nm.

Alternatively, SEAP can be detected using **HEK-Blue™ Detection**, a convenient and highly sensitive medium/detection reagent. However, supernatant from cells cultured in this medium cannot be used with QUANTI-Luc™ 4 Reagent. For more information, visit https://www.invivogen.com/hek-blue-detection.

IRF Induction

Below is a protocol for end-point readings using a luminometer. This protocol can be adapted for use with kinetic measurements.

1. Add 20 µl of test compound per well including a positive control (e.g. recombinant mIFN-β at 1 x 10^4 U/ml or 2'3'-cGAMP at 10 µg/ml final concentration) and endotoxin free water as a negative control.
2. Add 20 µl of a TLR4 agonist (e.g. LPS-EK Ultrapure at 1 µg/ml final concentration) in another well.

Note: This ligand will induce Lucia luciferase activity in the parental RAW-Dual™ cells but not in RAW-Dual™ KO-TLR4 cells.

3. Add 180 µl of cell suspension (**~200,000 cells**) per well of a flat-bottom 96-well plate.
4. Incubate the plate at 37 °C in a CO_2 incubator for 18-24 h.
5. Prepare QUANTI-Luc™ 4 Reagent working solution following the instructions on the data sheet.
6. Transfer 20 µl of RAW-Dual™ KO-TLR4 cells supernatant into a 96-well white (opaque) or black plate, or a luminometer tube.
7. Add 50 µl of QUANTI-Luc™ 4 Reagent working solution per well.
8. Proceed **immediately** with the measurement.

QUANTI-Blue™ Solution

Medium for detection and quantification of alkaline phosphatase in standard and HTS assays

Catalog code: rep-qbs, rep-qbs2, rep-qbs3

https://www.invivogen.com/quanti-blue

For research use only

Version 23A12-MM

PRODUCT INFORMATION

Contents: QUANTI-Blue™ Solution is available in three pack sizes

- **rep-qbs:** 5 x 1 ml of QB reagent and 5 x 1 ml QB buffer, sufficient to prepare QUANTI-Blue™ Solution for **25 x 96-well plates** (500 ml using the standard procedure) or **20 x 1536-well plates** (85 ml using the HTS screening procedure).
- **rep-qbs2:** 10 x 1 ml of QB reagent and 10 x 1 ml QB buffer, sufficient to prepare QUANTI-Blue™ Solution for **50 x 96-well plates** (1 L using the standard procedure) or **40 x 1536-well plates** (170 ml using the HTS screening procedure).
- **rep-qbs3:** 1 x 20 ml bottle of QB reagent and 1 x 20 ml bottle of QB buffer, sufficient to prepare QUANTI-Blue™ Solution for **100 x 96-well plates** (2 L using the standard procedure) or **80 x 1536-well plates** (340 ml using the HTS screening procedure).

Required Material (not provided)

- Sterile water
- Sterile screw cap tube, glass bottle or flask

Storage and stability

- Product is shipped at room temperature. Upon receipt, store QB reagent and QB buffer at -20 °C. Product is stable for 1 year at -20 °C when properly stored.
- The 20 ml bottles of QB reagent and QB buffer are designed for single use. If required, individual aliquots of QB reagent and QB buffer can be prepared upon receipt or following a single freeze-thaw cycle. Store aliquots at -20°C. **Avoid repeated freeze-thaw cycles**.

Note: During storage, a precipitate may form in the 20 ml bottle of QB reagent. If this occurs, vortex the product until the precipitate disappears. The formation of a precipitate does not affect the activity of the product.

- Reconstituted QUANTI-Blue™ Solution is stable for 2 weeks at 2-8 °C and for 2 months at -20 °C. Protect QUANTI-Blue™ from light.

Quality Control

Each lot is thoroughly tested to ensure the absence of lot-to-lot variation.

- Physicochemical characterization (pH, appearance).
- Functional assays using alkaline phosphatase or SEAP-expressing reporter cells.

DESCRIPTION

QUANTI-Blue™ is a colorimetric enzyme assay developed to determine any alkaline phosphatase activity (AP) in a biological sample, such as supernatants of cell cultures. QUANTI-Blue™ Solution changes from pink to a purple-blue color in the presence of AP. Secreted embryonic alkaline phosphatase (SEAP) is a widely used reporter gene. It is a truncated form of placental alkaline phosphatase, a glycosylphosphatidylinositol (GPI)-anchored protein. SEAP is secreted into the cell culture supernatant and therefore offers many advantages over intracellular reporters.

QUANTI-Blue™ is highly sensitive for quantitative measurement. It has a higher saturation threshold than with pNPP (p-nitrophenyl phosphate) resulting in more significant differences between no, low or high AP activity. Another advantage of QUANTI-Blue™ is that it can determine secreted AP activity without disturbing cells, thus allowing the repeated sampling of cell cultures for kinetic studies.

METHODS

QUANTI-Blue™ Solution has been optimized for use in 96-well plates (standard procedure) and in 1536-well plates (high throughput screening procedure).

A. Standard procedure

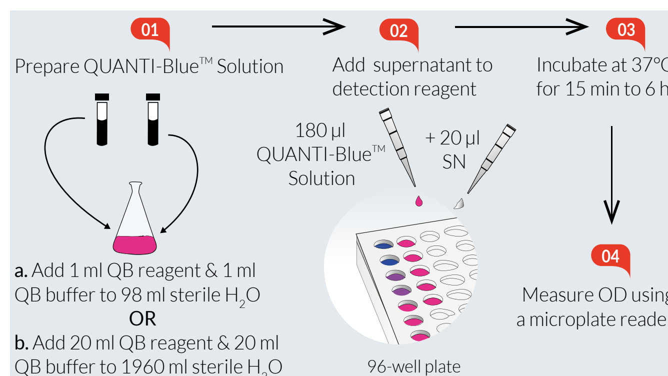

Figure 1. Standard procedure using QUANTI-Blue™ Solution.

The following protocol refers to the use of 96-well plates. Ensure QB reagent and QB buffer are completely thawed before use.

Note: For fast thawing, QB reagent and QB buffer can be placed at 37 °C for 2 minutes. Ensure heating at 37 °C does ***not*** *exceed 5 minutes.*

1. In a sterile bottle or flask, prepare QUANTI-Blue™ Solution by adding:
   a. **1 ml** of QB reagent and **1 ml** of QB buffer to **98 ml** of sterile water.
   b. **20 ml** of QB reagent and **20 ml** of QB buffer to **1960 ml** of sterile water.
2. Mix by vortexing and incubate at room temperature for 10 min before use.
3. Use QUANTI-Blue™ Solution immediately or store at 2-8 °C or -20 °C.
4. Dispense 180 µl of QUANTI-Blue™ Solution per well into a flat-bottom 96-well plate.
5. Add 20 µl of the sample (supernatant of SEAP-expressing cells) or negative control (cell culture medium).
6. Incubate at 37 °C for 15 min to 6 h.
7. Measure optical density (OD) at 620-655 nm using a microplate reader.

Note: If the negative control turns purple/blue, it means the fetal bovine serum (FBS) contains alkaline phosphatase. We recommend heating FBS at 56 °C for 30 min to inactivate the alkaline phosphatase activity.

For different cell culture plate formats, please refer to the table below:

	96-well plate	24-well plate	12-well plate
QUANTI-Blue™	180 µl	450 µl	900 µl
Supernatant	20 µl	50 µl	100 µl

B. High Throughput Screening (HTS) procedure

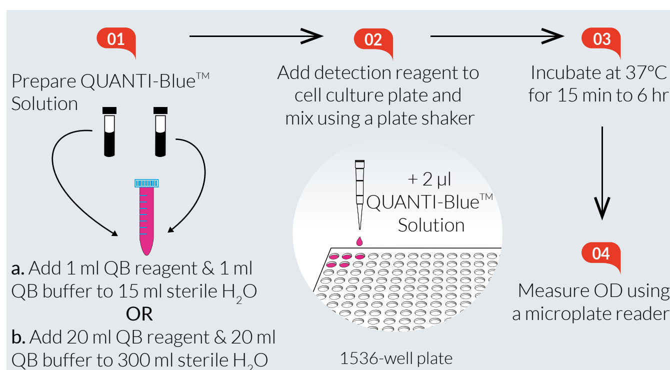

Figure 2. High throughput screening procedure using QUANTI-Blue™ Solution.

This procedure has been optimized for use in HTS screening procedures in 1536-well plates. QUANTI-Blue™ Solution is added directly to the cell suspension to reduce liquid handling.
Ensure QB reagent and QB buffer are completely thawed before use.
Note: For fast thawing, QB reagent and QB buffer can be placed at 37 °C for 2 minutes. Ensure heating at 37 °C does ***not*** *exceed 5 minutes.*

1. Dispense cell suspension and test compounds into a 1536-well plate in a volume that does not exceed **5 µl** per well. Incubate cells with test compounds for the desired period of time.
2. Prepare QUANTI-Blue™ Solution by adding:
   a. **1 ml** of QB reagent and **1 ml** of QB buffer to **15 ml** of sterile water in a sterile 50 ml screw cap tube.
   b. **20 ml** of QB reagent and **20 ml** of QB buffer to **300 ml** of sterile water in a sterile glass bottle or flask.
3. Mix well by vortexing and incubate at room temperature for 10 minutes before use.
4. Use QUANTI-Blue™ Solution immediately or store at 2-8 °C or -20 °C.
5. Dispense **2 µl of QUANTI-Blue™ Solution** to the wells containing ≤ 5 µl of cell culture in a 1536-well plate.
6. Mix using a plate shaker.
7. Incubate at 37 °C for 15 min to 6 h.
8. Measure OD at 620-655 nm.

Note: If the negative control turns purple/blue, it means the fetal bovine serum (FBS) contains alkaline phosphatase. We recommend heating FBS at 56 °C for 30 min to inactivate the alkaline phosphatase activity.

QUANTI-Luc™ 4 Reagent

A coelenterazine-based luminescence assay reagent

https://www.invivogen.com/quanti-luc

For research use only

Version 23A16-MM

PRODUCT INFORMATION

Contents

- 1 tube of **QUANTI-Luc™ 4 Reagent (20X)**

One tube of QUANTI-Luc™ 4 Reagent is sufficient for 5 x 96-well plates (25 ml standard Flash/end-point detection).

Note: This sample cannot be sold separately from the QUANTI-Luc™ 4 Lucia/Gaussia kit.

QUANTI-Luc™ 4 Lucia/Gaussia comprises two liquid components:

- QUANTI-Luc™ 4 Reagent 20X (coelenterazine substrate)
- QUANTI-Luc™ 4 Stabilizer 25X (optimized Glow assay reagent)

Find more information at https://www.invivogen.com/quanti-luc.

Storage and Stability

– Store QUANTI-Luc™ 4 Reagent at -20°C for up to 12 months.

– After preparation, the working solution is stable for 48 hours at 4°C and 1 month at -20°C. Prepare aliquots to avoid repeated freeze-thaw cycles.

Note: *This product is photosensitive and should be protected from light.*

Quality Control

Each lot is thoroughly tested to ensure the absence of lot-to-lot variation.

– Physicochemical characterization (pH, appearance).

– Functional assays using recombinant Lucia protein or reporter cells.

DESCRIPTION

QUANTI-Luc™ 4 Reagent is a component of the QUANTI-Luc™ 4 Lucia/Gaussia kit. It contains the coelenterazine substrate for the detection of secreted Lucia or Gaussia activity in live-cell supernatants, and of intracellular Renilla after cell lysis. The light signal produced correlates to the amount of luciferase protein expressed. It is quantified using a luminometer and expressed as relative light units (RLUs).

METHODS

Preparation of QUANTI-Luc™ 4 Reagent working solution (1X):

1. Dilute the total volume of the 20X tube (1.25 ml) of Reagent into 23.75 ml of sterile water to obtain 25 ml of working solution.
2. Vortex **very briefly** (a few seconds).
3. Use the working solution immediately or store until required for use. QUANTI-Luc™ 4 Reagent working solution can be stored for 48 hours at 4°C or 1 month at -20°C.

Flash detection of luciferase activity from cell culture medium:

To obtain **end-point readings** using a luminometer **with an injector**.

1. Set the luminometer with the following parameters: 50 µl of injection, end-point measurement with a 4 second start time and 0.1 second reading time.
2. Pipet 20 µl of sample per well into a 96-well white (opaque) or black plate, or a luminometer tube.
3. Prime the injector with QUANTI-Luc™ 4 Reagent 1X and proceed **immediately** with the measurement.

To obtain **end-point readings** using a luminometer **without injectors**.

1. Set the luminometer with a 0.1 second reading time.
2. Pipet 20 µl of sample per well into a 96-well white (opaque) or black plate, or a luminometer tube.
3. Add 50 µl of QUANTI-Luc™ 4 Reagent 1X to each well or tube.
4. Gently tap the plate several times to mix (do **not** vortex).
5. Proceed **immediately** with the measurement.
